the buckling coefficient is obtained for integral values of the aspect ratio. Correspondingly square half waves are the buckling mode shapes. Usually the plates are long in practice and for large aspect ratios the buckling coefficient is almost independent of the aspect ratio and is equal to the lowest value of 4.0. Hence the local buckling

Beam-column bar subject to simultaneous bending and compression. 2.1.2 Buckling modes for bars are categorized as follows (see Fig. 2.1): Flexural buckling of columns: bending about the axis of least resistance. Torsional buckling of columns: twisting without bending. Flex-ural-torsional buckling of columns: simultaneous twisting and bending.

buckling motion will vary by a factor of four depending only on how the two ends are restrained. Therefore, buckling studies are much more sensitive to the component restraints than in a normal stress analysis.

Similarly, displacement vector can be divided into two components:  $u_i = u_1 u_2 u_3$  where  $u_{1,2}$  is the in-plane components of the displacement vector, and  $u_3 = w$  is the out-of-plane components of the displacement vector and also called as the trans-

Structures 4 lecture notes Buckling Buckling calculations are very difficult except for a few special cases, and so numerical methods on a computer are almost invariably used in practice for buckling modes involving plates, shells and assemblies of beams and columns. Single columns and beams aren't too bad.
