An induction motor or asynchronous motor is an AC electric motor in which the electric current in the rotor needed to produce torque is obtained by electromagnetic induction from the magnetic field of the stator winding. An induction motor can therefore be made without electrical connections to the rotor. An induction motor's rotor can be either wound type or squirrel-cage type.

### **Induction motor - Wikipedia**

Electricity is the set of physical phenomena associated with the presence and motion of matter that has a property of electric charge. In early days, electricity was considered as being not related to magnetism. Later on, many experimental results and the development of Maxwell's equations indicated that both electricity and magnetism are from a single phenomenon: electromagnetism.

9.SHOP PRACTICES. Knowing about good electronic shop practices begins with introduction to the basic tools and test instruments used in electronic repair, production and troubleshooting. It continues with "hands-on" activity directed towards learning practical skills such as soldering and de-soldering and making connecting leads and cables.
