Parametric statistical procedures rely on assumptions about the shape of the distribution (i.e., assume a normal distribution) in the underlying population and about the form or parameters (i.e., means and standard deviations) of the assumed distribution.

“ Most methods studied so far have been based on the assumption of normally distributed data  
“ Frequently this assumption is not valid “ Sample size may be too small to verify it

### **Unit 14: Nonparametric Statistical Methods**

This book discusses the fitting of parametric statistical models to data samples. Emphasis is placed on (i) how to recognize situations where the problem is non-standard, when parameter estimates behave unusually, and (ii) the use of parametric bootstrap resampling methods in analysing such problems.

### **Non-Standard Parametric Statistical Inference - Oxford**

Non-parametric statistical inference is concerned with problems where the d.f.'s are not specified to such an extent, and where their functional form is unknown. This does not preclude some knowledge of the d.f.'s; for example, we may know that they are continuous, uni-modal, bi-modal, and the like.

One of these ways is to classify statistical methods as either parametric or nonparametric. We will find out what the difference is between parametric methods and nonparametric methods. The way that we will do this is to compare different instances of these types of methods.

Non-parametric (or distribution-free) inferential statistical methods are mathematical procedures for statistical hypothesis testing which, unlike parametric statistics, make no assumptions about the probability distributions of the variables being assessed. The most frequently used tests include
